

COVER LETTER

Dear Hiring Manager,

With **over 4.5 years of experience** in front-end development, I specialize in building **dynamic, real-time web applications** and **agentic AI-driven interfaces** using **Next.js, React.js, TypeScript** and modern **JavaScript (ES6+)**. My work focuses on turning complex back-end and LLM workflows into intuitive, responsive UIs that stream live data, surface intermediate reasoning artifacts, and keep users in the loop in real time.

In my current role at Velotio, I engineered an **advanced agentic chatbot interface** leveraging the **Vercel AI SDK** and **Server-Sent Events (SSE)** to deliver a fully dynamic, adaptive UI. This interface renders **live tool calls, LLM actions, and multi-step reasoning artifacts** directly on the frontend, giving users clear visibility into each step of the AI's decision-making process. I also contributed to an end-to-end **agentic solution architecture** that powers both **voice bots and chatbots**, orchestrated via modular flows using components like **OpenSearch, Guardrails, evaluation pipelines, and curated datasets** to ensure accuracy, safety, and real-time intelligence.

Previously at Gigmo Solutions, I led the front-end design and development of a **Payments module** built with **React.js, Redux, TypeScript** and backend APIs, where I integrated **SSE for real-time payment tracking** to reduce transaction uncertainty and improve user trust. I also developed a **real-time chat system** using **WebSockets**, delivering low-latency communication and a smooth UX across devices. Beyond that, I implemented robust **role-based access control (RBAC)** and dynamic permission management, and contributed to a **recommendation system** powered by **prompt engineering and the ChatGPT API** to provide intelligent, context-aware support experiences.

My project work further reflects this focus on dynamic, real-time frontends. For example, in an **ICU and OT management system**, I built an AI-enhanced dashboard using **React.js, TypeScript, Redux** with **SSE + WebSockets** for **live patient vitals streaming**, and integrated predictive visualizations via charts and automated discharge flows. These experiences have made me very comfortable turning continuously evolving data and LLM outputs into clear, actionable UI artifacts for end users.

Across roles, my toolkit includes **REST APIs, GraphQL, WebSockets, SSE, React Query/SWR/TanStack, Tailwind CSS, Styled Components, MUI**, and modern deployment workflows on **Vercel and Netlify**. I rely on **AI-assisted development** with tools like **ChatGPT, GitHub Copilot, and Cursor IDE** to accelerate delivery while keeping codebases clean and maintainable. Quality is reinforced through testing with **Jest, React Testing Library, and Enzyme**, helping reduce production issues and keep real-time UIs resilient under load.

I am excited about the opportunity to bring my experience in **real-time, dynamic frontends, agentic AI interfaces, and performance-focused React/Next.js development** to your organization. I would welcome the chance to discuss how I can help design and deliver modern, intelligent user experiences that directly support your product and business goals.

Yours faithfully,

Jai Sehgal
